MADE IN  
GERMANY  
IN THE  
HIGHEST  
QUALITY

## HEAT ALWAYS, WHEN YOU NEED IT

Thermotec is your partner for fast and flexible heat production in any location where the electricity is available. Our company has been a synonym for efficient accumulation heating panels in modern design for 20 years. We have been developing, producing and distributing high quality radiators that can be connected to any standard power grid (~ 230 AC).

## ACCUMULATION HEATING PANELS

### **Fast assembly, reliable operation**

Our development department has been constantly working on new technologies that make electricity heating a cheap option. The assembly is easy and this equipment quickly heats the required premises. Therefore, our accumulation heating panels can be used as the only source of heat for your home, as well as additional heating as required. Our accumulation heating panels are in particular great for rarely used rooms, such as a winter garden, a guest bathroom or a garden shelter, where they can be additionally mounted or even transferred without problems.

## THE MODERN DESIGN PROPOSED BY OUR OWN RESEARCH DEPARTMENT

Our radiators are built in a modern production plant with the automated assembly equipment and then painted in the in-house equipment using the high quality powder paint. All production steps are subject to constant quality control. Our development department, in the cooperation with research institutions, makes sure that we always use the state of art technology in our company.

## PRIME QUALITY

We produce the German branded quality right in our Saxon plant and grant the long-life warranty for all heating panels. Our products are delivered all over the world.

**For perfect indoor climate**

## AEROFLOW HEATING PANELS WITH THE CHAMOTTE ACCUMULATION CORE

All models with the chamotte memory core and lamellas are specially designed for better heat flow of heating panels

- with proven AeroFlow technology
- for a better room temperature climate and less swirling dust in the air
- with the efficient heating method thanks to quick heating phase and longer thermal stability without reheating
- with the long-life warranty
- with the timeless design

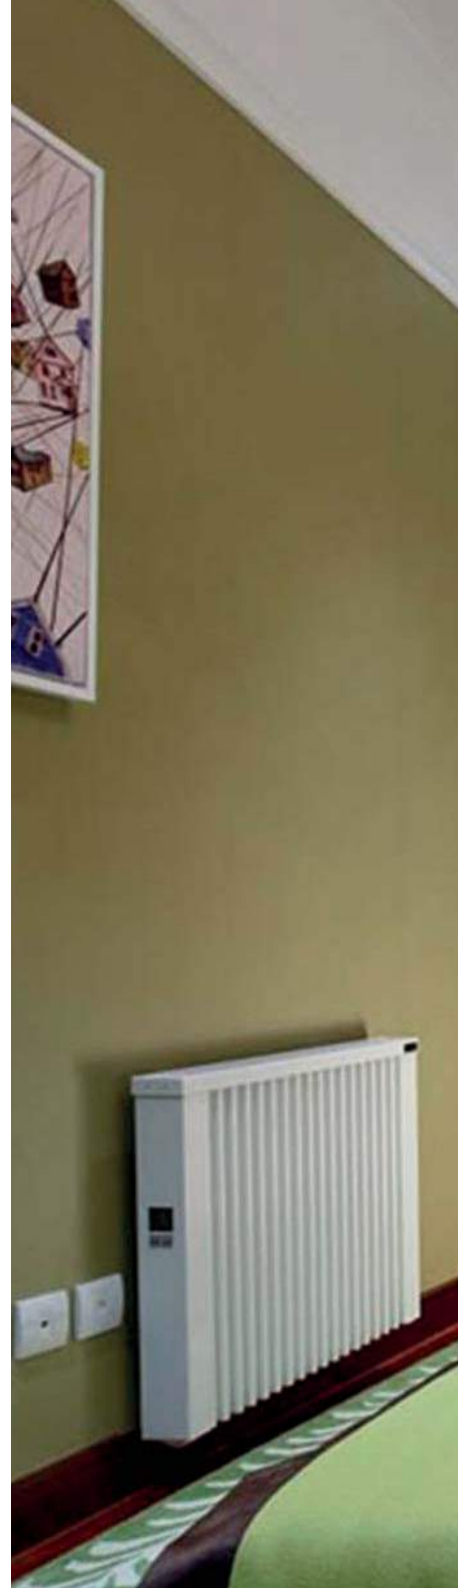

**For even more comfort and flexibility**

## COMFORTLINE FLEXISMART

Multifunctional controller

Take advantage of all three control options using a single controller. FlexiSmart offers each user the right option - manual temperature control, timing plan creation directly on the device or smart heater with the application.

## 1. Manual operation

It has the same function as a conventional rotary regulator and allows setting the desired room temperature directly on the radiator. Once the target temperature has been reached, the built-in regulator automatically switches off the heater.

## 2. Creating a heating schedule at the device

The integrated programmable thermostat enables convenient and easy control of the heating without the need for installation.

For every day of the week, you can set the desired temperature, reduce the temperature at night or protect against frost. Individually, you can set the times of activation and deactivation of heating in accordance with everyday events and enjoy the unique comfort every day.

## 3. Application control

The built-in thermostat can be equipped with a home interface that can be connected to the router. You can also control it from your smartphone or PS using a free application.

**INDIVIDUAL**
